Abstracts

Mining emulsion explosives are a class of industrial explosives characterized by a water-in-oil emulsion matrix, where microscopic droplets of an oxidizer-saturated aqueous solution are dispersed within a continuous fuel phase, resulting in a stable, water-resistant, and highly efficient explosive formulation primarily used in rock fragmentation across surface and underground mining operations, quarrying, and civil engineering projects. These explosives are distinguished by their enhanced safety profile compared to traditional dynamites and ANFO (ammonium nitrate/fuel oil) blends, as they are less sensitive to accidental initiation, exhibit superior resistance to water ingress, making them ideal for wet borehole conditions, and offer higher energy output and better control over blast performance parameters such as velocity of detonation and gas volume. The composition typically includes ammonium nitrate as the primary oxidizer, along with fuels like mineral oils or emulsifiers, and may incorporate sensitizers or density modifiers to optimize performance for specific geological conditions and application requirements.

The global Mining Emulsion Explosives market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
