Abstracts

Mining photogrammetry systems are based on digital image processing and non-contact optical measurement technology. They capture images of the mine terrain, equipment, or ore from multiple angles, and then use algorithms to calculate and accurately obtain parameters such as three-dimensional coordinates, displacement, and volume. These systems are widely used in open-pit mining planning, slope monitoring, and ore volume measurement. Their gross profit margin varies significantly depending on the complexity of the technology and the application requirements: high-precision industrial-grade systems can have a gross profit margin of 50%-60%, while consumer-grade or simplified equipment has a gross profit margin of approximately 20%-30%.

The global Mining Photogrammetry System market size was estimated at USD 145.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.70% during the forecast period.
