Abstracts

Mining tailings management refers to the comprehensive set of processes, technologies, and strategies employed to handle, store, treat, and repurpose the waste materials?typically a slurry of finely ground rock, water, and residual chemicals?generated after the extraction of valuable minerals from ore. This encompasses the design, construction, and maintenance of tailings storage facilities (TSFs), dewatering and thickening techniques to reduce water content, methods for recovering residual minerals or reprocessing tailings, and long-term monitoring to mitigate environmental risks such as water contamination, acid mine drainage, dust emissions, and structural failures of containment structures. The discipline integrates environmental science, geotechnical engineering, and regulatory compliance to minimize ecological impact, enhance safety, and align with sustainable mining practices, while increasingly exploring opportunities for circular economy applications, such as using tailings in construction materials or extracting critical elements.

The global Mining Tailings Management market size was estimated at USD 4250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
