Abstracts

An Missile Defense Weapon System is a comprehensive framework designed to detect, track, intercept, and neutralize incoming missile threats, including ballistic, cruise, and hypersonic missiles. These systems integrate advanced radar technologies, satellite tracking, command-and-control units, and interceptor missiles to provide layered protection for strategic assets, military installations, and civilian areas. Key components often include early warning sensors, mid-course interception technologies, and terminal-phase defenses, ensuring multi-stage engagement capabilities. In recent years, integrated anti-missile interception technology has been regarded as a core area of strategic defence by many countries in the world, but only a few countries have mastered this technology at present. The difficulty of its development has been compared to: "It's like hitting a bullet with a bullet hundreds of kilometres away." At present, the United States, Russia and China, France are the main countries that have mastered this technology, but the development status is different between them, owing to the arms race between the United States and the former USSR during the Cold War period, which led to the earliest development time in the world for the United States and Russia. For example, the Soviet Union first developed the S-75 Dvina, and the US has invested more than \$400 billion in various missile defence projects since the 1950s, when it first launched a programme of systems designed to intercept incoming nuclear or conventional weapons. Other governments have since invested in strengthening their own military capabilities by encouraging their own companies to join the research and development effort. Owing to geopolitical tensions in recent years, Integrated Air and Missile Defence has become the basis for guaranteeing national security, and some countries with research and development capabilities have continued to invest significant amounts of military expenditure to have more complete systems, while others lacking research and development capabilities have been scrambling to acquire them. Sufficient funds for future markets As technology has yet to break through, there

are still no reliable and effective anti-missile systems to counter intercontinental ballistic missiles (ICBMs), for example. The Patriot and SAD missile defence systems, which are designed to counter short-range missiles, have had greater success in testing, but their utility is limited to a relatively small area of coverage. From a development standpoint, there will continue to be enormous amounts of public money invested in this category in the future, thus Integrated Air and Missile Defence has a positive market ahead of it. "Integration" degree gradually increased Existing air defense and anti-missile most of the single operation, which is a complex and diverse reality of the threat, there are certain deficiencies, some enterprises have been realized in the existing air defense and anti-missile system based on the joint operation, through the combination of traditional aerodynamic targets and ballistic missiles, hypersonic weapons, to build a more complete and comprehensive Integrated Air and Missile Defense. Such as the Russian S-500 missile system and the U.S. military based on the Aegis Combat System, etc. as well as France, Italy, the United Kingdom and other countries equipped with the Aster air defence The Aster missiles can defend against supersonic anti-ship missiles, warplanes, ballistic missiles and other capabilities, and are still being upgraded. In view of the complex and volatile international situation and rapid technological development, air defence and anti-missile technology needs to focus on the iterative innovation of existing technologies and the exploration of future technologies. Facing the development of the world's scientific and technological revolution and the military revolution, it is necessary to closely follow the needs of future air defence and anti-missile combat capabilities, grasp the direction of technological development in the field of weaponry, promote the exploration of cutting-edge technologies and systematic innovations, strive for breakthroughs in a number of core and key technologies, and intensify tracking and research of basic technologies, so as to consolidate the defence force through technological development and innovation and provide strong support for the development of national defence and military forces in the long term.
