Abstracts

Mitoxantrone injection is a synthetic antineoplastic agent and immunosuppressant used primarily in the treatment of certain types of cancer, including acute myeloid leukemia, advanced prostate cancer, and relapsed or refractory non-Hodgkin's lymphoma, as well as in the management of multiple sclerosis to reduce neurological disability and the frequency of clinical relapses. It functions as a topoisomerase II inhibitor and intercalating agent, disrupting DNA synthesis and repair in rapidly dividing cells. Marketed under brand names such as Novantrone, this chemotherapeutic agent is typically administered intravenously in clinical settings under strict medical supervision due to its potential for severe side effects, including cardiotoxicity, myelosuppression, and secondary malignancies. Its use is generally reserved for specific patient populations and clinical scenarios where the benefits are deemed to outweigh the risks, and it remains an important, though niche, therapeutic option within oncology and neurology.

The global Mitoxantrone Injection market size was estimated at USD 120.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
