Abstracts

Mixed Acid Etchants (MAE) refer to highly corrosive chemical solutions composed primarily of nitric acid (HNO₃) and hydrofluoric acid (HF), often with additives or modifiers to control reaction rates, selectivity, and surface finish. These formulations are engineered to selectively remove specific materials—most notably silicon, silicon dioxide, and various metals—through controlled chemical dissolution, making them indispensable in semiconductor manufacturing, microelectromechanical systems (MEMS) production, and precision metal etching processes. The composition can be tailored to achieve anisotropic or isotropic etching behavior, with parameters such as concentration, temperature, and agitation carefully optimized to meet exacting industrial requirements for feature resolution, etch rate uniformity, and minimal substrate damage.

The global Mixed Acid Etchants (Mae) market size was estimated at USD 350.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
