Abstracts

Mixed metal heat stabilizers are a class of thermal stabilizers used primarily in the processing of polyvinyl chloride (PVC) and other halogenated polymers to prevent degradation caused by heat and shear during manufacturing, such as extrusion, injection molding, and calendaring. These stabilizers typically consist of combinations of metals commonly including calcium, zinc, barium, and sometimes rare earth elements which work synergistically to absorb hydrochloric acid released during thermal decomposition, thus delaying the autocatalytic breakdown of the polymer chain and maintaining material integrity, color stability, and mechanical properties. They are favored in applications requiring low toxicity and environmental compliance, such as in packaging, medical devices, and potable water pipes, as they offer a safer alternative to traditional lead-based stabilizers while providing efficient heat stabilization and cost-effectiveness.

The global Mixed Metal Heat Stabilizer market size was estimated at USD 450.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
