Report Overview

Multilayer capacitors consist of a monolithic ceramic block with comb-like sintered electrodes. These electrodes come to the surface at the face ends of the ceramic block where an electrical contact is made by burnt-in metallic layers. 5G communication can be used for high-speed processing of large capacity data in the high frequency range, but due to the characteristics of the high frequency range, many base stations are required. Moreover, compared to 4G LTE, the number of receiving antennas and components in 5G communication base stations increases, resulting in increased power consumption and heat generation. Therefore, the MLCC loaded on the 5G communication base station must have the characteristic of high capacity in order to minimize the actual installed area of parts and ensure stable supply of staff. In addition, in order to reduce power loss, high voltage products are required for the characteristics of base stations that use high operating voltage. At the same time, in order to operate normally in environmental changes such as temperature and humidity, high reliability is required.
