Abstracts

Metallised ceramics, specifically molybdenum-manganese (Mo-Mn) metallised ceramics, refer to a class of ceramic materials such as alumina, beryllia, or steatite that have been coated with a metallisation layer composed primarily of molybdenum and manganese powders, often applied via screen printing and subsequently fired in a controlled atmosphere to form a robust, hermetic, and electrically conductive bond between the ceramic substrate and the metal coating. This process enables the ceramic component to be brazed or soldered to metal parts, making it integral in applications requiring high thermal conductivity, electrical insulation, mechanical strength, and resistance to extreme temperatures and corrosive environments. Key uses include substrates and packages in power electronics, semiconductor devices, RF/microwave components, laser diodes, aerospace sensors, and automotive control systems, where reliable performance under thermal cycling and harsh conditions is critical.

The global Mo Mn Metallised Ceramics market size was estimated at USD 120.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
