Report Overview

Although small, CGM can improve the quality of life of millions of diabetes patients worldwide. For example, in patients with Type 1 diabetes, the current routine method is fingertip blood sampling to detect blood sugar, which is essential every day. In fact, fingertip blood collection can only occur up to 7 times a day. But this can only obtain a single point in time snapshot of blood sugar. Unfortunately, this snapshot can only provide blood glucose values for a specific period of time, and cannot provide all-weather blood glucose values for diabetes patients. Diabetes patients also can not obtain the overall changes in blood glucose and the reasons for the changes, so they can not develop targeted sugar control programs in line with specific individuals, including diet, medication, exercise, etc.
