Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Mobile Broadband Module competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Mobile broadband, also known as MBB, is a service that leverages cellular network technologies (such as 4G LTE and 5G NR) to provide users with high-speed internet access. Its core features are mobility and wireless connectivity. Users no longer rely on fixed physical cables (such as network cables or fiber optic cables) and can access the internet through specialized hardware devices wherever there is mobile network coverage. Mobile broadband modules are primarily found in hardware devices, which have built-in cellular network modems and accept SIM cards for mobile network signal reception. In 2024, global Mobile broadband modules production reached approximately 112.1 M units, with an average global market price of around US\$ 66.12 per unit. According to statistics, only one-third of households worldwide have access to wired broadband, and only one-quarter can enjoy speeds above 100 Mbps. In sparsely populated areas, building a wired network is particularly uneconomical, making wireless deployment feasible. Even in developed regions like North America and Western Europe, fiber optic network coverage is only 30%, resulting in a significant market demand for mobile broadband modules. While urban areas in China have good fiber optic network coverage, mobile broadband modules are still needed for network access in remote mountainous areas, newly built industrial parks and factories, and ports.

The global Mobile Broadband Module market size was estimated at USD 7412.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 16.10% during the forecast period.
