## Abstracts

Mobile gamma camera system is an imaging technique to generate functional scans of small organs. It consist of small detectors with a reduced field of view for small organ studies such as heart, thyroid, liver, lungs, etc. This system is a fully mobile device that can be used at bedside thus eliminating the need to transport patient. A dual-head mobile camera system can be ideal for general SPECT as well as for a whole body bone scanning; while a dual-head system with opposing detectors may be advantageous for cardiac SPECT as the SPECT data can be captured in a 180 degree arc. Triple-head mobile camera are the most commonly adopted systems for brain and cardiac SPECT. The cost of dual-head or triple-head system is much higher than a single-head mobile gamma camera system. The multi-head mobile camera system facilitates faster acquisition and provides much better image resolution as compared to aforementioned systems. Thus, development of such ideal systems will bring in new growth opportunities in the mobile gamma cameras market.

The global Mobile Gamma Cameras market size was estimated at USD 51.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
