Report Overview

Mobile gas turbine gensets are typically thermal electric type power plants, where all the component equipment is installed on a transport vehicle and attached to a moving vehicle that can carry this generator set swiftly. These are utilized in a variety of applications that demand temporary or emergency power. Typically, the main motors for such mobile power plants are gas turbines. The equipment also contains the switching apparatus, full cable network, auxiliary equipment, control panel, automation & signaling systems, and replacement components in addition to the electric generator and primary motor. For places with poor infrastructure, these power plants provide flexible, decentralized power generation and a quick supply of electricity. These are employed in the event of a natural disaster, such as an earthquake or a flood. These can also be used to power equipment used in building railroads and logging operations, and exploratory drilling rigs. At a position far from the main power transmission lines, these act as the main power source. They also act as backup supplies in situations when other power is typically accessible.
