Report Overview

NAND flash memory is a type of nonvolatile storage technology that does not require power to retain data. An important goal of NAND flash development has been to reduce the cost per bit and to increase maximum chip capacity so that flash memory can compete with magnetic storage devices, such as hard disks.

Compared to RAM + NOR, NAND based MCP solutions provide non-volatile storage of data. This means, unlike in the past when DRAM memory was used, NAND memory retains data even when the power is off — making it ideal as storage for portable devices. Similarly, POP and high-density embedded storage chips reduce the number of chips employed in a mobile device, thereby saving space and simplifying the design. Bosson Research's latest report provides a deep insight into the global Mobile NAND Flash market covering all its essential aspects.
