Abstracts

Mobile payment SD cards are specialized microSD cards that integrate Near Field Communication (NFC) technology and secure elements, enabling contactless payment functionality on devices that lack built-in NFC capabilities, such as older smartphones, tablets, or cameras. These cards function by storing encrypted payment information and communicating with point-of-sale terminals to facilitate transactions, effectively transforming non-NFC devices into tools for digital payments. The technology relies on embedded security chips to protect sensitive data, complying with financial industry standards, and typically requires companion software for activation and management. While offering a bridge for legacy devices to participate in the growing cashless economy, their utility is closely tied to the prevalence of NFC-enabled payment terminals and the degree of support from financial institutions and payment networks.

The global Mobile Payment Sd Card market size was estimated at USD 125.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 10.50% during the forecast period.
