Abstracts

Mobile radiography systems are portable X-ray devices designed to provide diagnostic imaging capabilities at the patient's bedside or in settings where conventional fixed X-ray systems are impractical, such as intensive care units, emergency departments, nursing homes, surgical suites, or during home healthcare visits. These systems typically consist of a mobile X-ray generator mounted on a wheeled base, a digital detector, and a workstation for image acquisition and processing, enabling healthcare providers to obtain high-quality radiographic images without transporting critically ill or immobile patients. The technology has evolved from earlier analog and computed radiography (CR) systems to modern digital radiography (DR) systems, which offer faster imaging, lower radiation doses, improved workflow efficiency, and seamless integration with picture archiving and communication systems (PACS) and electronic health records (EHR). Key features often include wireless detectors, battery-powered operation, compact design for maneuverability in tight spaces, and advanced imaging software with tools for image enhancement and analysis.

The global Mobile Radiography Systems market size was estimated at USD 1082.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.35% during the forecast period.
