The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on MOCA Curing Agent competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. MOCA Curing Agent (4,4'-methylenebis(2-chloroaniline)) is a commonly used aromatic diamine vulcanizing agent, primarily used for crosslinking and curing polyurethane elastomers (especially cast polyurethanes). It imparts excellent mechanical properties, wear resistance, tear resistance, and heat resistance to products, making it widely used in high-intensity, heavy-load environments. Global production in 2024 was estimated to be approximately 39,000 tons, with an average selling price of US\$2,750 per ton. MOCA is a diaminodiphenylmethane derivative, typically synthesized from 4,4'-diaminodiphenylmethane (DDM) and formaldehyde via the MOCA method. MOCA plays a crucial role in polyurethane elastomers due to its excellent crosslinking and curing properties. However, due to its potential carcinogenicity, regions such as Europe, the United States, and Japan have restricted its use, with a shift towards low- or non-toxic chain extenders as alternatives. However, in China and some emerging markets, MOCA still enjoys significant market demand due to cost and performance limitations.

The global MOCA Curing Agent market size was estimated at USD 105.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.90% during the forecast period.
