Report Overview

MOCVD stands for Metal-Organic Chemical Vapour Deposition. This is a technique for depositing thin layers of atoms onto a semiconductor wafer. Using MOCVD you can build up many layers, each of a precisely controlled thickness, to create a material which has specific optical and electrical properties. Using this technique it's possible to build a range of semiconductor photodetectors and lasers, the devices that lie at the heart of the information revolution.

Since MOCVD technique is used to produce high-brightness LEDs, it is expected that the increasing demand for high-brightness LEDs will fuel the growth of the market. Furthermore, the increasing demand for renewable sources of energy such as solar energy is another major driver for this market. Semiconductor manufacturers are using the MOCVD process to manufacture high-efficiency triple junction photovoltaic cells that can maximize the efficiency of photovoltaic cells in converting sunlight to electricity.
