Report Overview

A mode-locked femtosecond laser is a laser capable of generating ultrashort pulses in the femtosecond range. Mode-locked femtosecond lasers generate ultrashort pulses by locking the modes in the optical cavity at a certain frequency and phase. Mode-locked femtosecond lasers usually use a resonant cavity structure that contains a nonlinear crystal or nonlinear fiber to produce nonlinear effects to compress the pulse width. The output pulses of mode-locked femtosecond lasers usually have very short pulse widths (femtosecond levels) and high peak powers, capable of producing extremely high light intensities. This kind of laser has a wide range of applications in scientific research, medicine, materials processing and other fields, such as ultrafast spectroscopy, optical microscopy, laser cutting and micro-machining.

The global Mode Locked Femtosecond Laser market size was estimated at USD 325.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
