## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Modified Aliphatic Amine Hardener competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Modified Aliphatic Amine Hardener production reached approximately 127,000 tons with an average global market price of around US\$ 2,800 per ton, a single-line production capacity of approximately 3,000 tons/year, and a gross profit margin of approximately 10%-30%. Modified Aliphatic Amine Hardener is a curing agent derived from aliphatic amine structures and chemically modified to enhance curing performance, application versatility, and user handling properties in epoxy and related resin systems. Through molecular adjustments such as adduct formation, incorporation of flexible segments, hydrophilic modification, or catalyst introduction, these hardeners provide improved pot life control, reduced volatility and odor, enhanced color stability, faster or low-temperature curing ability, and better compatibility and wetting with substrates. They are commonly used when superior weather resistance, low yellowing, moisture tolerance, and balanced mechanical strength are required, making them suitable for coatings, adhesives, flooring systems, composite materials, and electronic encapsulation applications where both appearance and durability are important. The value chain for modified aliphatic amine hardeners spans upstream raw material development, midstream formulation and resin system production, and downstream application across coatings, adhesives, composites, and construction materials. Upstream activities involve the supply of aliphatic amine feedstocks, polyetheramines, reactive diluents, functional modifiers, curing accelerators, and specialty additives that adjust viscosity, pot life, cure speed, and weathering resistance. In the midstream stage, chemical manufacturers tailor modified aliphatic amine hardeners through molecular modification, blending, and functionalization to achieve

low odor, low toxicity, blush resistance, improved UV stability, and compatibility with epoxy resin systems. Downstream, the products are used by formulators and end-use industries in protective coatings for marine and industrial structures, flooring systems, civil engineering bonding and grouting, composite parts for wind energy and automotive sectors, and maintenance and repair chemicals.

The global Modified Aliphatic Amine Hardener market size was estimated at USD 355.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.40% during the forecast period.
