Abstracts

Modified Methylaluminoxane (MMAO) is a chemical compound derived from methylaluminoxane (MAO), itself a hydrolysis product of trimethylaluminum, and is modified by the addition of longer-chain alkyl groups such as isobutyl or n-octyl to enhance solubility, stability, and performance as a co-catalyst in olefin polymerization processes, particularly in the production of polyolefins like polyethylene and polypropylene using metallocene and other single-site catalysts, where it serves to activate the catalyst by abstracting ligands and stabilizing the active cationic species while also scavenging impurities that could deactivate the catalyst system.

The global Modified Methylaluminoxane market size was estimated at USD 520.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
