Abstracts

Automobile lights lenses generally use optical grade PMMA, optical grade PC and other materials. The advantages of optical grade plastics are: simple technology and low production cost. The disadvantage is that the high temperature resistance and aging resistance are relatively weak. PMMA generally has a temperature resistance of no more than 90 ° (heat deformation temperature of 105 °), while PC has a temperature resistance of no more than 120 ° (heat deformation temperature of 135 °). This report reports that the modified plastics used for car lights are polycarbonate and polymethyl methacrylate (PMMA).

The global Modified Plastic for Automobile Lights market size was estimated at USD 2142.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
