Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Modified Polycarbonate competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Modified polycarbonate refers to an engineering plastic that has significantly improved physical properties, mechanical properties, thermal properties, flame retardancy or processing properties on the basis of the base material polycarbonate (PC) through blending, filling, reinforcement, flame retardancy, alloying and other means. Since unmodified polycarbonate has certain limitations in heat resistance, dimensional stability, flame retardancy or weather resistance, modification technology enables it to better meet the high-performance requirements of different fields. Modified polycarbonate is usually optimized by adding glass fiber, flame retardant, UV resistant agent, toughening agent, mineral filler, or alloying with other polymer materials. The modified polycarbonate material has significantly improved strength, toughness, weather resistance, electrical properties and flame retardancy, and is widely used in electronics, automobiles, construction, medical and optics. The technical threshold of the modified polycarbonate industry is relatively high, involving multiple technical links such as polymer material formula design, additive system, blending modification process, rheology control, and flame retardant system optimization. Different application scenarios have different requirements for material performance, which requires fine-tuning of formulas and processing control, and a strong driving force for R&D. With the diversified development of the downstream market, customers' requirements for material performance are becoming increasingly segmented. Modified polycarbonate products often need to be customized according to terminal application scenarios (such as automobiles, electrical appliances, medical treatment, etc.), including color, flame retardant grade, temperature resistance, fluidity and other

indicators, with the characteristics of "multiple varieties and small batches".

The global Modified Polycarbonate market size was estimated at USD 6527.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
