## Abstracts

Modified viscose fiber refers to a chemically altered form of traditional viscose rayon, engineered to enhance specific properties such as strength, moisture management, dye affinity, or sustainability. These modifications can include cross-linking agents, nanotechnology integrations, or blending with other polymers to improve performance in applications ranging from apparel to technical textiles. Unlike conventional viscose, which is derived from wood pulp through a process involving carbon disulfide, modified variants often aim to reduce environmental impact—for example, by using closed-loop systems in production—or to meet specialized demands like antimicrobial functionality, elasticity, or flame resistance. The resulting fibers combine the inherent benefits of viscose, such as breathability and softness, with tailored characteristics that expand their usability across diverse sectors.

The global Modified Viscose Fiber market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
