A modified water-soluble polymer refers to a water-soluble polymer that has been chemically or physically modified to exhibit specific properties or enhanced performance. It is usually obtained by introducing certain functional groups or making structural adjustments to the original water-soluble polymer through methods such as copolymerization, grafting, cross-linking, or blending. These modifications can endow the polymer with improved solubility, viscosity, stability, surface activity, film-forming ability, or other desired characteristics. Modified water-soluble polymers are widely used in various fields such as water treatment, oilfield exploitation, paper making, coatings, adhesives, and biomedicine, playing an important role in improving product quality and process efficiency.
