Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Modified Waxy Potato Starch competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Modified Waxy Potato Starch refers to waxy potato starch that has undergone further physical, enzymatic, or chemical treatments to enhance or alter its natural properties. While waxy potato starch itself is primarily composed of amylopectin, leading to properties like high viscosity and good clarity, the "modified" aspect means it has been specifically engineered to improve its performance under various processing conditions. These modifications can enhance its stability against heat, acid, shear, and freeze-thaw cycles, improve its texture (e.g., smoother, more elastic), adjust its viscosity profile, or enhance its water-binding capacity. This makes modified waxy potato starch exceptionally versatile for demanding food applications, where it can act as a superior thickener, stabilizer, or texturizer, particularly in products requiring high processing tolerance and excellent final product quality.

The global Modified Waxy Potato Starch market size was estimated at USD 809.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
