Report Overview

A modulated thermography analyzer is an instrument for thermal analysis that analyzes the properties of a sample based on the temperature change that occurs when the sample is irradiated with light. The instrument generates periodic temperature changes by periodically applying a light source on the sample surface, and uses an infrared camera to record the temperature changes. By analyzing and processing the recorded temperature change data, information such as thermal conductivity, thermal diffusivity, and heat capacity of the sample can be obtained. Modulated thermal imaging analyzers are widely used in materials science, chemistry, biology and other fields.

The global Modulated Thermal Imaging Analyzer market size was estimated at USD 185.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
