## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Mogroside competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of mogrosides was 14,000 tons, with an average price of US\$24/kg. Mogroside is the main sweet ingredient in monk fruit and is a natural non-sugar sweetener. It has the characteristics of high sweetness and low calories. Its sweetness can be more than 300 times that of sucrose and it contains almost no calories. Mogroside can not only be used as a food additive, but also in the fields of medicine and health care products. The upstream of the mogroside industry chain mainly involves the supply of raw and dried mogroside fruit, concentrated in Yongfu and Lingui, Guangxi. Its cost is primarily determined by the price of the raw fruit, manual harvesting, and initial drying. Downstream demand is concentrated and growing rapidly, mainly driven by sugar-free beverage companies, functional food companies, nutritional supplement brands, and manufacturers of baked goods and diabetes-friendly foods. Beverage and solid beverage formulation companies are the core purchasers, typically requiring the use of mogroside V or higher purity to ensure a pure sweetness without a grassy taste. European, American, and Japanese brands prefer 50% mogroside V powder for sugar-free tea drinks and ready-to-drink plant-based beverages, while many domestic food factories use 20%-40% mogroside content in their formulations for sweetening, with its usage continuously increasing in sugar-free milk tea powder, sugar-free coffee powder, chewable tablets, and functional powders. The downstream market is characterized by the replacement of synthetic sweeteners with natural ones, increased demand for compound formulations, and a significant rise in export orders. This is particularly evident in the sugar-free beverage, zero-sugar baking, and healthy snack industries, where mogrosides have become a crucial ingredient due to their high

sweetness, heat stability, and natural labeling advantages. Industry trends include increased penetration of natural high-intensity sweeteners driven by global demand for sugar control, beverage companies accelerating the replacement of synthetic sweeteners like aspartame and acesulfame potassium with mogrosides, and increased regulatory acceptance of natural sweetener labels in Europe and the US, driving export growth of high-purity mogrosides. Key drivers include accelerated growth in sugar-free beverages, upgraded functional food consumption, improved upstream varieties increasing the content of mogrosides in the original fruit, and advancements in production technology reducing off-flavors. Obstacles include the high risk of climate and disasters due to the concentrated production areas of mogrosides, high energy consumption and unstable yields in high-purity mogroside production, long registration cycles for mogroside ingredients in the international market, and continued price sensitivity compared to stevia and erythritol. In terms of single-line production capacity, high-purity mogroside V and IV-V synthesis lines typically have an annual output of 120-300 tons, while medium- and low-purity mogroside production lines have an annual output of 400-700 tons. The gross profit margins differ significantly, with high-purity mogroside V typically having a gross profit margin of 35%-50%, while medium- and low-purity mogrosides have a gross profit margin of approximately 20%-30%.

The global Mogroside market size was estimated at USD 338.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
