### Report Overview

Inductor is an element that can convert electrical energy into magnetic energy and store it. The structure of an inductor is similar to a transformer, but with only one winding. The inductor has a certain inductance, it only hinders the change of current. If the inductor is in a state where no current is flowing, it will try to prevent the current from flowing through it when it is on; if it is in the state, it will try to maintain the current when the circuit is off. Inductors are also called chokes, reactors, and dynamic reactors.
