## Abstracts

Molded Underfill (MUF) Materials are a type of encapsulation material used in the semiconductor packaging process, particularly in advanced packaging technologies like Flip-Chip. They are applied to provide mechanical support, enhance thermal management, and improve the overall reliability of semiconductor devices. The core driving force behind the growth of the MUF materials market stems from the dual impetus of technological advancements and evolving demands in the electronics industry. On one hand, as semiconductor devices evolve toward 3D packaging and high-density integration, advanced processes like flip-chip packaging impose stricter requirements on materials' thermal conductivity and mechanical stability, making MUF materials a critical solution for thermal management challenges due to their superior performance. On the other hand, the surging computing power of smart devices and rising power density in data centers have created urgent needs for efficient thermal dissipation materials and reliable packaging solutions, with MUF materials' low moisture absorption and weather resistance further aligning with applications in high-reliability sectors such as automotive electronics and aerospace. Simultaneously, the miniaturization trend of electronic products demands packaging materials capable of multifunctional integration within nanoscale spaces, as MUF materials support advanced packaging technologies through molecular-level structural design, driving their widespread adoption in consumer electronics, communication infrastructure, and other fields.

The global Molded Underfill (MUF) Materials market size was estimated at USD 580.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.00% during the forecast period.
