Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Molding Inductor competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Molding Inductor sales reached approximately 20,175 million units, with an average global market price of around 207.5 US\$/k unit. Molding inductors are advanced power inductive components manufactured through an integrated molding process, where the wire coil is encapsulated in magnetic powder material and pressed into a solid structure. This design offers significant advantages over traditional wound inductors, including compact size, improved thermal management, reduced electromagnetic interference (EMI), and enhanced mechanical robustness. As a result, molding inductors are widely adopted in smartphones, tablets, wearable devices, 5G communication equipment, automotive electronics, and industrial power supplies. Advances in material science, especially the development of iron-based and alloy magnetic powders, combined with automated molding technologies, have further improved the performance of these inductors, enabling them to operate reliably under higher frequencies and harsher environments. Global Molding Inductor include Cyntec, TDK, YAGEO Group, Vishay and Shenzhen Microgate Technology, etc. Global top five manufacturers hold a share around 55%. The largest market is Asia-Pacific, has a share around 70%, followed by North America and Europe, with around 14% and 12% market share respectively. In terms of application, the largest application is Consumer Electronics, has a share over 78%, followed by Automotive Electronics, AI Servers & Traditional Servers, Industrial Equipment, RF & Telecommunications and Medical Devices, etc. In the consumer electronics sector, with the widespread adoption of 5G smartphones, tablets, and wearable devices, the demand for thinner, lighter, and more efficient devices is driving a growing demand for small, high-frequency inductors. In automotive electronics,

applications such as new energy vehicle electric drive systems, DC-DC converters, onboard chargers, and ADAS are placing higher demands on high-current-carrying and high-reliability molded inductors. Automotive-grade products are becoming a key development direction for the industry. The rapid adoption of third-generation semiconductor materials (SiC and GaN) is accelerating the evolution of power systems toward high frequency and high efficiency, posing new challenges to the thermal resistance and loss control of inductors and driving continuous upgrades in materials and processes.

The global Molding Inductor market size was estimated at USD 4186.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.60% during the forecast period.
