Report Overview

Molecular dynamics (MD) is a computer simulation method for analysing the physical movements of atoms and molecules. The atoms and molecules are allowed to interact for a fixed period of time, giving a view of the dynamic 'evolution' of the system. In the most common version, the trajectories of atoms and molecules are determined by numerically solving Newton's equations of motion for a system of interacting particles, where forces between the particles and their potential energies are often calculated using interatomic potentials or molecular mechanics force fields. The method is applied mostly in chemical physics, materials science, and biophysics.

The global Molecular Dynamics Simulation Software market size was estimated at USD 51 million in 2023 and is projected to reach USD 72.59 million by 2032, exhibiting a CAGR of 4.00% during the forecast period.
