Abstracts

Molecular dynamics (MD) is a computer simulation method for analysing the physical movements of atoms and molecules. The atoms and molecules are allowed to interact for a fixed period of time, giving a view of the dynamic "evolution" of the system. In the most common version, the trajectories of atoms and molecules are determined by numerically solving Newton's equations of motion for a system of interacting particles, where forces between the particles and their potential energies are often calculated using interatomic potentials or molecular mechanics force fields. The method is applied mostly in chemical physics, materials science, and biophysics. Global Molecular Dynamics Software key players include D.E. Shaw Research, YASARA Biosciences, MBN Research Center, Culgi BV, Intel, etc. Global top five players hold a share about 70 %. Aisa-Pacific is the largest market, with a share about 50%, followed by North America and Europe, having a total share about 45 percent. In terms of product, GPU-accelerated is the largest segment, with a share about 70%. And in terms of application, the largest application is Materials Science Research, followed by Chemical Physics Research and Biophysics Research.
