Abstracts

Molecular sieve powder refers to a class of synthetic or natural aluminosilicate materials with uniform, microporous structures that function as highly efficient desiccants and adsorbents due to their precise pore size, typically ranging from 3 to 10 angstroms, which allows for selective adsorption based on molecular size and polarity. These powders are characterized by their high surface area, thermal stability, and regenerative properties, making them critical in applications such as gas and liquid drying, purification processes in petrochemical and natural gas industries, air separation, and as catalysts or catalyst supports in refining and chemical synthesis. Their functionality is defined by the type of cation present (e.g., sodium, potassium, calcium) and framework type (e.g., 3A, 4A, 5A, 13X), which determine specific adsorption capacities and selectivity for molecules like water, carbon dioxide, nitrogen, or oxygen.

The global Molecular Sieve Powder market size was estimated at USD 315.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
