Report Overview

Molecular sieves are the material with small pores of uniform size. Molecular Sieves are crystalline alumino- silicates known as Zeolites. Molecular sieves crystals characterized by three-dimensional pore systems along with same crystals identified together.

Molecular sieves are used as absorbents for fluids (gas and liquids). Molecular sieve absorbents have ability to separate fluids on the basis of molecular size and polarity. In case of hydrocarbon parafines, straight molecules fit into pores and get adsorbed. The branched molecules can't fit into pores and pass through sieve bed.
