Report Overview

Molybdenum-99 (Mo-99) and its decay product Technetium-99m (Tc-99m) are critical isotopes used in nuclear medicine, particularly for diagnostic imaging procedures such as single-photon emission computed tomography (SPECT). Mo-99 is produced primarily in nuclear reactors through the fission of uranium-235, while Tc-99m is extracted from Mo-99 generators and used in over 80% of diagnostic nuclear medicine scans worldwide due to its ideal gamma-ray emissions and short half-life (6 hours), which minimizes patient radiation exposure. The market is heavily dependent on a limited number of aging production facilities, creating supply chain vulnerabilities. Recent efforts have focused on developing alternative production methods, such as accelerator-based systems or low-enriched uranium targets, to ensure stable supply and reduce reliance on highly enriched uranium (HEU), which poses proliferation risks. Demand for Tc-99m remains strong, driven by the increasing prevalence of cancer and cardiovascular diseases, though the market faces challenges such as regulatory hurdles, high production costs, and competition from alternative imaging technologies like PET scans. Geopolitical factors and reactor shutdowns for maintenance further impact supply reliability, making this a strategically sensitive sector with ongoing investments in capacity expansion and technological innovation.

The global Molybdenum-99 Technetium-99m market size was estimated at USD 613.2 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
