Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Molybdenum Disulfide Lubricating Coating competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Molybdenum Disulfide Lubricating Coating production reached approximately 716 tons, with an average global market price of around US\$ 126 per kilogram. In 2024, the global 's total production capacity of Molybdenum Disulfide Lubricating Coating reached 920 tons. The industry average gross profit margin of this product reached 26%. A molybdenum disulfide lubricating coating is a dry film that reduces friction and wear by forming a low-friction surface with high load-carrying capacity. It works by allowing its crystalline layers to shear easily, with the weak bonds between layers allowing them to slide over each other. These coatings are used in applications where liquid lubricants fail, such as in high-pressure, high-temperature, or vacuum environments, and they are applied via methods like spraying or dipping. The upstream sector of the industrial chain forms the foundation of molybdenum disulfide coating technology, primarily comprising molybdenum disulfide raw materials, chemical raw materials, binders, and substrate materials. Molybdenum disulfide raw materials primarily come from the extraction and processing of molybdenum ore. Nano-molybdenum disulfide, due to its superior lubricity and anti-wear properties, is becoming a key area of ??industry upgrading and is supplied by companies such as Nanoshel and Jinmo Co., Ltd. Chemical raw materials and binders are used to secure molybdenum disulfide powder to component surfaces. Common organic or inorganic binders include epoxy resins and silicates. The substrate material, to which the coating adheres, includes various types of steel, alloys, and composites. The quality of its surface treatment directly impacts the coating's bond strength and service life. The midstream segment transforms upstream raw materials into a usable coating product, typically a

dry film lubricant, typically mixed with a binder in solution or solid form. The exceptional performance of molybdenum disulfide coatings has made them an indispensable component of many high-end manufacturing industries. In the aerospace sector, they are used in satellite components, spacecraft mechanisms, and critical aircraft parts, providing reliable lubrication in extreme environments such as vacuum and alternating high and low temperatures. The automotive manufacturing industry uses it in engine parts, fasteners, universal joints, etc., helping to reduce friction, lower energy consumption and extend part life.

The global Molybdenum Disulfide Lubricating Coating market size was estimated at USD 90.22 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
