Report Overview

The mono-material trays are one the most trending topics in today's packaging industry, fulfilling the demand for super lightweight trays for food packaging. The mono-material trays are made of polypropylene, which is very easy to seal and very robust. On the other hand, mono-material trays also provide heat-resistant ability which make them suitable for hot filling and microwave use. When we refer to "mono plastic" in the context of plastic packaging, we mean the use of just one type of material for the whole pack. Traditionally, trays used by the food industry would be a combination of materials, such as PET, PP, PVC or similar and PE. PET being used for the body of the tray, with a laminated PE base film being used to bond the packaging together. To separate a PET tray laminated with a PE layer is a long and costly chemical process. Using a mono plastic solution - for example, a tray made entirely from PET that can be sealed without the need for a sealant layer - means the product is 100% recyclable.

The global Mono-Material Trays market size was estimated at USD 675 million in 2023 and is projected to reach USD 988.44 million by 2030, exhibiting a CAGR of 5.60% during the forecast period.

North America Mono-Material Trays market size was USD 175.89 million in 2023, at a CAGR of 4.80% during the forecast period of 2024 through 2030.
