### Report Overview

The single crystal half-cell module is to use the laser cutting method to cut the standard specification cell into the same two half-cells along the direction perpendicular to the battery busbar, and then weld them in series. Since the voltage of the solar crystalline silicon cell is independent of the area, and the power is proportional to the area, the voltage of the half-cell cell is unchanged compared with the whole cell, the power is halved, and the current is halved.

The global Monocrystalline Half Chip Module market size was estimated at USD 1250.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
