Report Overview

Monocrystalline silicon, also known as single-crystal silicon, is made of pure silicon in an ordered and continuous single crystal structure. It is generally used as a light absorbing material in photovoltaic applications.

The adoption of renewable energy sources is resulting in reduced dependence on imported crude oil for countries that have few or no petroleum reserves, reduced application of petroleum-based fuels, and expansion of energy mix. Solar energy does not cause emissions, which in turn, propels the demand for photovoltaic panels that convert sunlight to electricity. As a result, the demand for monocrystalline silicon is also rising as it is widely used in the manufacturing of photovoltaic panels.
