Abstracts

A monocular ophthalmoscope is a handheld medical device used by healthcare professionals to examine the interior structures of the eye, specifically the retina, optic disc, blood vessels, and vitreous humor, through a single eyepiece. It typically consists of a light source, a set of lenses for focusing, and various apertures to control illumination and filter types, enabling detailed observation of ocular health and aiding in the diagnosis of conditions such as glaucoma, diabetic retinopathy, and macular degeneration. Unlike binocular models, which provide stereoscopic vision, monocular ophthalmoscopes offer a direct, magnified view and are valued for their portability, ease of use, and affordability, making them particularly common in general practice, emergency settings, and among medical students and trainees.

The global Monocular Ophthalmoscopes market size was estimated at USD 95.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.35% during the forecast period.
