Abstracts

Monocyte Activation Test (MAT) is an in vitro detection method. The monocyte activation test is based on the biological characteristics of monocytes or monocyte cell lines that release a series of proinflammatory cytokines (such as TNF- α , IL-1 β , IL-6, etc.) after being stimulated by exogenous pyrogens (such as endotoxins). These proinflammatory cytokines are key indicators for evaluating whether monocytes are activated. The main purpose of the monocyte activation test is to evaluate whether there are contaminants in the test sample that can activate monocytes to release proinflammatory cytokines, such as endotoxins, bacteria, viruses, fungi, etc. These contaminants may cause adverse reactions such as fever in the human body, so the monocyte activation test is of great significance in the safety evaluation of drugs, biological products, medical devices and other fields. With the development of the medical industry and the improvement of people's health awareness, the safety requirements for drugs and biological products are becoming increasingly stringent. As an important means to evaluate whether there are potential pyrogens in drugs and biological products, the market demand for monocyte activation test has also increased. Medical devices may be contaminated by microorganisms during production and use, and monocyte activation test can be used to evaluate their safety. With the continuous expansion of the medical device market and the improvement of regulatory requirements, the demand for monocyte activation test is also continuing to grow. With the development of related disciplines such as biotechnology and immunology, the technical level of monocyte activation test has been continuously improved, providing strong support for the expansion of the market. At the same time, the government's policies on medical safety, drug supervision and other aspects are also constantly improving, providing a good policy environment for the healthy development of the monocyte activation test market.

The global Monocyte Activation Test market size was estimated at USD 85.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 20.00% during the forecast period.
