Abstracts

Monodisperse PEG refers to a highly purified, uniform form of polyethylene glycol (PEG) with a narrow molecular weight distribution, meaning that the polymer chains in the material are of nearly the same length. This is in contrast to conventional PEG, which typically has a broad distribution of molecular weights. The term "monodisperse" indicates that the polymer is more homogeneous, offering consistent performance in applications requiring precise molecular characteristics. Monodisperse PEG is often synthesized by controlled polymerization methods that limit the variation in chain lengths, making it ideal for specialized applications in industries like biotechnology, pharmaceuticals, and materials science.

The global Monodisperse PEG market size was estimated at USD 2462.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.00% during the forecast period.
