Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Monolithic Positive Drive Belts competitive dynamics, regional economic interdependencies, and supply chain reconfigurations.Monolithic positive drive belts are transmission and conveying systems manufactured through extrusion of thermoplastic polyurethane or similar polymers, characterized by their single-layer structure without fabric reinforcement or adhesive bonding. Their distinctive feature lies in the toothed profile that meshes precisely with sprockets, ensuring slip-free positive drive and highly efficient power transmission. These belts also offer excellent wear resistance, oil resistance, and antimicrobial properties, making them easy to clean and maintain, particularly suitable for industries with stringent requirements for hygiene, safety, and reliability, such as food processing, pharmaceutical manufacturing, and packaging. In 2024, the production of Monolithic Positive Drive Belts was approximately 1.1 million square meters, with an average price of $290 per square meter.The outlook for monolithic TPU conveyor belts is highly promising, driven by the acceleration of industrial automation, increasingly stringent food safety regulations, and the growing demand for energy-efficient and environmentally friendly conveying solutions. Looking ahead, innovations in TPU materials—such as enhanced antimicrobial properties and optimized mechanical performance—will further expand their applications in industries that require high reliability and strict hygiene standards.

The global Monolithic Positive Drive Belts market size was estimated at USD 320.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 2.80% during the forecast period.
