Abstracts

Monomer polyether is an oligomer with an ether bond (- R-O-R -) in the main chain and more than 2 hydroxyl groups (- OH) in the end or side groups. Its structural characteristics endow it with high reactivity, excellent physical and chemical properties, as well as unique solubility and dispersibility. The synthesis of monomeric polyether mainly uses three types of raw materials, including organic oxides (such as propylene oxide, ethylene oxide, etc.), furan cyclic compounds (such as tetrahydrofuran), and initiators (such as polyols such as sorbitol, sucrose, pentaerythritol, glycerol, etc.). In addition, catalysts are needed to promote the progress of the reaction. The synthesis process usually includes steps such as raw material pretreatment, ring opening polymerization reaction, and post-treatment procedures.

The global Monomer Polyether market size was estimated at USD 2787.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.30% during the forecast period.
