Abstracts

Mononuclear Cell Preparation Tubes are specialized devices used in laboratory settings to separate and prepare cells, particularly blood cells, for various analyses and applications. These tubes are designed to facilitate the efficient and consistent isolation of specific cell types from whole blood or other biological fluids. Mononuclear Cell Preparation Tubes with a draw blood volume of 8 ml are specifically designed for the collection and preparation of blood samples, typically for the isolation of peripheral blood mononuclear cells (PBMCs). Mononuclear Cell Preparation Tubes with a draw blood volume of 4 ml are designed for the collection and processing of smaller blood samples, primarily for the isolation of specific cell populations like peripheral blood mononuclear cells (PBMCs). Due to the COVID-19 pandemic, the global Mononuclear Cell Preparation Tubes market size is estimated to be worth US\$ 79.93 million in 2023 and is forecast to a readjusted size of US\$ 112.67 million by 2030 with a CAGR of 5.07% during the review period. Growing need for performing blood tests owing to instances of numerous types of diseases is one of the key reasons boosting the global blood collection tubes market. US & Canada is the largest consumption place, with a consumption market share nearly 50.98% in 2023. Following US & Canada, Europe is the second largest consumption place with the consumption market share of 21.84%. The rising emphasis on early disease detection and diagnostics, particularly in conditions like cancer and infectious diseases, is driving the need for high-quality blood sample preparation tools. CPTs are used to isolate cells that can be analyzed for early signs of disease.

The global Mononuclear Cell Preparation Tubes market size was estimated at USD 83.8 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
