Abstracts

Mononucleosis diagnostic refers to the range of clinical tools and laboratory tests used to detect infectious mononucleosis, primarily caused by the Epstein-Barr virus (EBV), through methods such as the monospot test (a rapid heterophile antibody test), EBV-specific antibody testing (including IgM and IgG antibodies against viral capsid antigen, early antigen, and nuclear antigen), polymerase chain reaction (PCR) for viral DNA detection, and complete blood count (CBC) analyses showing lymphocytosis and atypical lymphocytes. These diagnostics are essential for differentiating mononucleosis from other illnesses with similar symptoms, such as streptococcal pharyngitis, cytomegalovirus infection, or toxoplasmosis, and are widely utilized in outpatient clinics, hospitals, and diagnostic laboratories to confirm infection, guide treatment decisions, and prevent complications. The accuracy, speed, and accessibility of these tests vary, with point-of-care rapid tests favoring quick initial screening and more specific serological or molecular assays used for confirmatory purposes in ambiguous cases.

The global Mononucleosis Diagnostic market size was estimated at USD 245.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
