Abstracts

Bentonite is characterised by exchangeable cations such as Ca^{2+} , Mg^{2+} , Na^{+} or Li^{+} which affect its designation and properties. For example, bentonite is typically described as either swelling or nonswelling bentonite. Swelling bentonite (also known as western bentonite) is sodium bentonite that swells in water and is generally used in its natural state. Non-swelling bentonite is calcium bentonite (also known as southern bentonite) that is used as mined, after treatment with soda ash to produce sodium-exchanged bentonite, or treated with acid to produce bleaching clay. Li-rich bentonite is known as hectorite and is commercially mined only in the US. Natural bentonites occur in two main forms: Na-based and Ca-based. While Ca-bentonite is more common, Na-bentonite is a more effective binder. To boost the binding power of Ca-bentonite, it is subjected to a chemical reaction with soda ash to activate its outer and inner surfaces, which increases its ability to bind water. Global key players of Montmorillonite Nanoclays include Minerals Technologies (Amcol), Clariant, Imerys (S&B), etc. The top three players hold a share over 44%. North America is the largest market, with a share about 32%, followed by Europe and Asia-Pacific, with share 31% and 29%, separately. In terms of product type, Sodium Bentonite is the largest segment, occupied for a share of 86%. In terms of application, the largest one is Molding Sands, with a share about 24 percent.

The global Montmorillonite Nanoclays market size was estimated at USD 2408.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
