Abstracts

A MOSFET output photorelay, also known as a solid-state relay (SSR) with a MOSFET output stage, is an optoelectronic device that combines an infrared light-emitting diode (LED) with one or more power MOSFETs to provide electrical isolation and switching functionality. It functions by using light from the LED to activate the MOSFET output, enabling control of AC or DC loads without mechanical parts. Key characteristics include high insulation resistance, fast switching speeds, low power consumption, silent operation, and long lifespan due to the absence of contacts. These devices are widely used in applications requiring high reliability, noise immunity, and precise switching, such as industrial automation, test and measurement equipment, medical devices, energy management systems, and automotive electronics.

The global Mosfet Output Photorelay market size was estimated at USD 456.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
