The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Mosquito Traps competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of mosquito traps is reach 31.1 million units, with an average price of US\$22 per unit. Mosquito traps are devices designed to attract, capture, and kill mosquitoes to help control their populations and reduce the risk of mosquito-borne diseases. These traps mimic the stimuli that mosquitoes naturally seek, such as carbon dioxide (CO₂), heat, light, moisture, or scents, to lure them into a mechanism that prevents their escape. The mosquito trap market is experiencing rapid expansion and positive technological advancements. Key drivers of this growth include the global rise in mosquito-borne infections such as dengue fever, chikungunya, and Zika virus; residents' increasing pursuit of quality of life and health awareness; and the increasing density of urban populations and the growing mosquito problem caused by accelerated urbanization. The vitality of this market is reflected not only in its continued expansion but also in the coordinated development and continuous innovation across the industry chain. Technological progress and product innovation are key drivers of market growth. The mosquito trap industry is experiencing a surge in technological innovation, with new types of traps constantly emerging. The integration of intelligence and the Internet of Things (IoT) has become a mainstream trend. New-generation products deeply integrate IoT technologies and artificial intelligence algorithms. Smart sensors monitor ambient temperature, humidity, and mosquito density in real time, automatically adjusting operating modes. Some high-end models are already integrated with smart home systems, supporting remote control and data analysis via mobile apps. Bionic trapping technology is gaining widespread application. Based on the discovery that the core reason mosquitoes find humans and bite is carbon dioxide expelled during human

and animal respiration, research and development has focused on products that mimic the human body by using carbon dioxide, heat, light, moisture, or odor to attract mosquitoes. For example, new materials are being developed to efficiently absorb low concentrations of carbon dioxide from the air and release them at high concentrations, simulating human respiration. Photocatalytic technology, a leading environmentally friendly mosquito control technology, uses the synergistic effect of ultraviolet light and photocatalytic materials (such as titanium dioxide) to produce a catalytic reaction under illumination that mimics the carbon dioxide and temperature exhaled by the human body, significantly enhancing mosquito attraction and achieving both efficient trapping and physical mosquito control. In terms of environmental protection and sustainable development, product design is placing greater emphasis on material recyclability and energy efficiency. The preparation process for nano-titanium dioxide materials is continuously being optimized, and some companies are beginning to use biodegradable materials in mosquito trap components and developing solar power systems. The mosquito trap industry chain structure is well-defined. The upstream sector primarily comprises raw material supply, including titanium dioxide (as a photocatalytic material), UV lamps, circuit boards, sensors, plastic casings, and metal materials. The midstream sector encompasses the manufacturing process, responsible for the production and assembly of various mosquito traps. Downstream applications encompass a wide range of environments, including homes (especially those with pregnant women and infants), villas, courtyards, residential communities, parks, hospitals, hotels, restaurants, stadiums, and agricultural plantations. In the competitive market, internationally renowned manufacturers such as Biogents, Mosquito Magnet, Qista, and DynaTrap have a competitive advantage in the high-end market thanks to their technological advantages and brand influence. The Chinese market has already established a number of influential brands, such as Jiuliang, Chaowei, Green Yinglu, Yager, and Mosquito Doctor. Foshan Green Yinglu Electrical Technology Co., Ltd. owns several independent brands, including Green Yinglu GREENYELLOW and Bastion, and has obtained over 160 authorized patents. Its customers span over 40 countries and regions, and its professional mosquito repellents and other products are sold in many major supermarket chains. Chengdu Xuliang Technology Development Co., Ltd., as a representative of innovative enterprises, uses its intelligent ecological mosquito trapping machine to use independently developed new materials to enrich and release carbon dioxide to simulate human breathing. The device has been deployed in many places such as the Chengdu World Games Village. The capture method has been upgraded from wind suction to electric shock physical capture, and the efficiency has increased by more than 40%.

The global Mosquito Traps market size was estimated at USD 685.0 million in 2025 and

is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
